ENGINEERING

Civil engineers plan, design, and supervise the construction and maintenance of structures such as:

- Buildings
- Bridges
- Roads
- Dams
- Pipelines
- Water and sewage systems

Civil engineering is one of the oldest engineering disciplines and involves a wide range of elements such as structural design, geotechnical analysis, water resources management, pollution control, transportation systems, and construction practices. The Civil Engineering program prepares students to apply scientific principles to the design, construction and implementation of civil infrastructure systems, build cities that are resilient to natural disasters, and protect the natural environment from stresses imposed by humans.

Our engineering curriculum offers students options to become “engineers and more” in career development such as:

- A five-year MBA and engineering degree
- A coastal resilience certificate upon completion of additional coursework
